METHOD FOR
THE NEOGENESIS
OF CELL AGE
ABSTRACT

Izumi Arai

My invention newly regenerates the life age of individuals, clone bodies, organs, tissues, cells, etc., which were thought to grow old and to die. By using germ-line cells in individuals and clone bodies of various creatures, I regenerate new cell age clone bodies, organs, tissues, cells, etc. By repeating these processes exchanging old organs, tissues, cells, etc., for these new ones, I prevent the senility of individuals. And I can maintain long-term excellent functions of individuals, organs, tissues, cells, etc. With using germ-line cells (1-20) in individuals and clone bodies of creatures, by making use of somatic cells (21) including $2n$ germ cells, use of diploid (22), use of cell fusion (23), etc., I can produce clone bodies (24). From these groups, I can make new groups (28) of newly-regenerated clone bodies (27) by fertilization (26), parthenogenesis (25), etc. I can resurrect ancient creatures, by joining crossable and fertile closely-related species to newly-regenerated clone body groups (28), and as well, by creating generations such as female germ cells from crossing newly-regenerated clone bodies and preserved DNA, RNA, germ cells, etc., and by repeated processes crossing these newly regenerated generations such as female germ cells with these closely-related species, preserved DNA, RNA, germ cells, etc. When there are creatures which can reproduce by virgin development, I resurrect these creatures artificially by parthenogenesis (25) with physical and chemical treatments. Since cytoplasm of eggs (20) in itself has the rejuvenating nature which brings back the age of cells growing old, with making the most of these

many clone body groups of various levels systematically, I can obtain further new cells infinitely, and I can rejuvenate individuals forever.
